kubectl

Kube cuddle
tipps & tricks

- Set default namespace
- Set default editor

Set default namespace

How to set the default namespace

This is usefull if you work in a special namespace for many commands/tasks

```
kubectl config set-context --current --namespace=<namespace>
# Example
kubectl config set-context --current --namespace=nginx
```

Set default editor

How to set the default editor

If you use the command "kubectl edit" you may not want to use vi as editor, so you can expose your preferred editor with a normal environment variable expose.

```
expose EDITOR=<your prefered editor>
# Example
expose EDITOR=vim
```
